## DETAILED ACTION

### *Election/Restrictions*

1. Restriction to one of the following inventions is required under 35 U.S.C. § 121:
  - I. Claims 29-47 and 53-54, drawn to a gas measuring device for identifying substances in flowing gas, based on ion mobility, using a reference cell, ionization section, and analysis cell, are classified in Class 250, subclass 288.
  - II. Claims 48-52 and 55-56, drawn to a method for an identification of substances in flowing gas, wherein electric fields are set up between electrodes in electrode pairs; a gas sample is taken to be transported through the reference electrode pair and is analyzed, are classified in Class 250, subclass 282.

The inventions are distinct, each from the other because of the following reasons:

Inventions I and II are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different designs, modes of operation, and effects (MPEP § 802.01 and § 806.06). In the instant case, the different inventions are distinct, each from each other because of the following reasons: The claims of Invention I disclose a gas measuring device for identifying substances in flowing gas, based on ion mobility, wherein it has a cell structure comprising a flow channel for controlling a gas flow, a reference cell arranged to form a reference signal, an ionization section for achieving the ionization effect into the sample gas, and an analysis cell arranged to form an analysis signal so that the reference cell, the ionization section, and the analysis cell are located in said order in the direction of flow of the sample gas in the flow channel.

The claims of Invention II disclose a method for an identification of substances in flowing gas, based on electrical mobility of ions, wherein it has the following steps, in which a first electric field is set between electrodes in a reference electrode pair; a second electric field is set between electrodes in an analysis electrode pair; a gas sample is taken to be transported through the reference electrode pair, an ionization section and the analysis electrode pair in said order; and the gas sample is analyzed.

Because these inventions are independent or distinct for the reasons given above and have acquired a separate status in the art in view of their different classification, restriction for examination purposes as indicated is proper.
